

The Harvest Prompt

The sentence this whole dojo was built with — and the two moments to say it.

Every substantial task in this workshop — every drill, every handout, every page of the dojo — ended the same way. Not with delivery. With **one standing sentence**, said after the work was accepted:

Great! Well done. It looks perfect. Based on the tasks we completed, please review and generate the new skills and knowledge we can acquire. We would like to use such new skills for the next or future issues we will face.

It looks like a compliment. It is a **harvest**. The output goes to whoever asked for it — and the *lesson*, which is the part that would otherwise evaporate, is cut, named, and stored before the conversation closes. The work is not the crop. **The repeatable part of the work is the crop.**

There are two harvests, and they bring in different crops

After success

the moment the output is accepted — while what worked is still in your hands

Ask: *what did we just do that we will do again?*

The crop: a repeatable procedure. The steps, the prompt that carried them, the check that proved it worked — written while you can still see why each one was there.

The day after failure

the only moment you know exactly what the instructions should have said

Ask: *what would the page have needed to say for this not to have happened?*

The crop: a map of landmines. A week later the details are gone; the day after, they are precise. This week's best lessons were all of this kind — a licence we stated wrongly and had to correct, a page that quietly served an old version, a scroll that promised an art nobody had been taught.

Most people do neither. Some do one. **The loop is complete only with both** — success writes the recipes, failure writes the warnings, and neither can write the other's page.

You already know this shape

It is the **CLOSE prompt** from *One File, Three Assistants*, pointed at a different target. That prompt makes the assistant write the project note at the end of a conversation. The harvest prompt makes it write the **skill** at the end of a task. Same primitive both times:

Take the last step nobody ever does, turn it into a standing request to the AI, and make it a habit.

The note is memory for a project. The skill is memory for a *kind of work*. Fifteen seconds each, and both survive any change of tool, plan or employer.

The reveal, since it is the last day: the page you are reading, the forty-seven drills, the skills on the shelf above — none of it was planned in advance. It was **harvested**, night by night, from whatever that day's work taught, using exactly the sentence in the box. The dojo is not a curriculum that was delivered. **It is a week of harvests, stored where the village can reach them.** Your own file can grow the same way, starting tonight.

The work is finished when the lesson is stored —
not when the output is delivered.
